

# StoreHub Frontend Overhaul Summary

This refresh focused on making the product feel calmer, easier to scan, and more premium from the first second. The goal was to make the app feel intentional and human, not just more colorful.

## What changed

? I rebuilt the visual foundation with soft glass panels, warmer gradients, cleaner spacing, and a more polished overall shell so the app feels cohesive instead of page-by-page.

? The sidebar and top navigation were redesigned to be much easier to understand at a glance. Each destination now has a clearer purpose and the active context is always visible.

? The login experience was reworked into a more welcoming, product-level landing screen with clearer actions, stronger hierarchy, and a smoother sign-in flow.

? The dashboard was turned into a true morning briefing: clearer KPIs, a calmer AI report area, better getting-started guidance, and more readable low-stock and recent-sales sections.

? Inventory was rebuilt around quick understanding and quick action. The page now surfaces inventory health immediately, improves search visibility, and makes add/edit workflows feel less cramped.

? POS was redesigned for speed and confidence, with a more obvious product grid, a stronger cart summary, and a checkout flow that keeps totals and payment status easy to follow.

## Issues fixed or improved

? I fixed a checkout typing mismatch introduced during the redesign so the sale creation flow aligns with the project schema again.

? Several empty states are now more helpful and action-oriented instead of leaving the user at a dead end.

? A lot of the old UI had good functionality but weak visual hierarchy. That has been tightened up so the important numbers and actions stand out much faster.

## Verification notes

? I attempted a full frontend typecheck and build after the redesign.

? The repo still has pre-existing TypeScript errors outside the files I overhauled, including issues in BarcodeScanner, OnboardingPage, ReportsPage, SuppliersPage, and seed data typing in dataService.

? The Vite build is also blocked in this environment by an esbuild spawn permission error. So the redesign work is implemented, but the project still needs those existing repo-wide issues cleared before a clean full build passes here.

## **Files touched for the redesign**

? artifacts/storehub/src/index.css

? artifacts/storehub/src/components/Layout.tsx

? artifacts/storehub/src/pages/auth/LoginPage.tsx

? artifacts/storehub/src/pages/DashboardPage.tsx

? artifacts/storehub/src/pages/InventoryPage.tsx

? artifacts/storehub/src/pages/POSPage.tsx
